(54) Tille: METHOD OF INCREASING TOUGHNESS OF HEAT-AFFECTED PART OF STEEL PRODUCT WELDED JOINT

(54) 発明の名称: 鋼材の溶接継手における熱影響部の靭性向上方法

(57) Abstract: A method of increasing the toughness of heat-affected part of multilayer welded joint, lap fillet welded joint or one or more pass high heat input welded joint with respect to steel products. In particular, a method of increasing the toughness of heat-affected part of steel product welded joint, characterized in that beating by means of ultrasonic vibration terminal or shot-peening by means of ultrasonic vibration steel balls is applied to the surface of heat-affected part formed by final pass of steel product multilayer welded joint, so that in a metal structure adjacent to fusion line (FL) of welded metal and host metal at the heat-affected part formed by final pass, the average of major diameters of crystals lying in the zone from steel product surface to depth of 2 mm or more becomes equal to the crystal grain diameter of host metal before welding at a depth of 1/4 of sheet thickness (t) from the steel product surface.

(57) 要約: 鋼材の多層溶接継手、隅肉溶接継手、 1 パスまたは数パスの大入熱溶接継手における熱影響部の靭性向 上方法を提供するもので、鋼材の多層溶接継手の最終パスにより形成された熱影響部の表面に、
